

Design the following pages as part of your to do list app. The app will contain only two screens which looks like below designs. (feel free to modify or improve it further)

Your menu should contain two options to choose from.

1. Manage Categories
2. Schedule Task

1. CATEGORIES SCREEN [Right Side] ->

- the categories screen will contains list of all task categories added by the user.
- User can add new category, delete category, update existing category details.
- User can add new category using plus button located at the top right of the screen.

2. SCHEDULE SCREEN [Left Side] ->

- The schedule screen will contain details related to the tasks. By default it will display the list of tasks added by the user.
- User can click on the plus button (present at the top right corner of the screen) to add new task.. it should open a popup/modal where user can enter

task name, choose date or time, and select the category from the drop down. The drop-down (select input) should display only those categories which are present on the categories screen. (categories added by user earlier)

NOTE: *The data added by user should be stored and persisted in some storage whether it is local storage or database but it should be there even when we reload the screen.*
